

AI-Powered Welfare Monitoring in Poultry Production

Enhancing Research and Farm Management

Jack O'Sullivan, Helen E. Gray, Genevieve Moat, Lucy Asher

The Challenge: Poultry Welfare Monitoring

- Flock size & density
 - Up to 9 hens per m³
- Limited ability to observe individuals
- Early welfare indicators difficult to detect
- Diverse environments
 - Housing Style/Layout
 - Access to outside
 - Enrichment
 - Individualised husbandry practices
- Require methods to improve visibility of potential problems
 - Early recognition
 - Longitudinal monitoring beyond manual ability
 - Resource Conscious
 - Adaptable

Why Piling?

Collection of densely packed birds in the shed or on the range.

Costs the egg industry approx. £6.5 million/year in deaths.

Can lead to sublethal impacts on health.

Responsible for ~20% deaths.

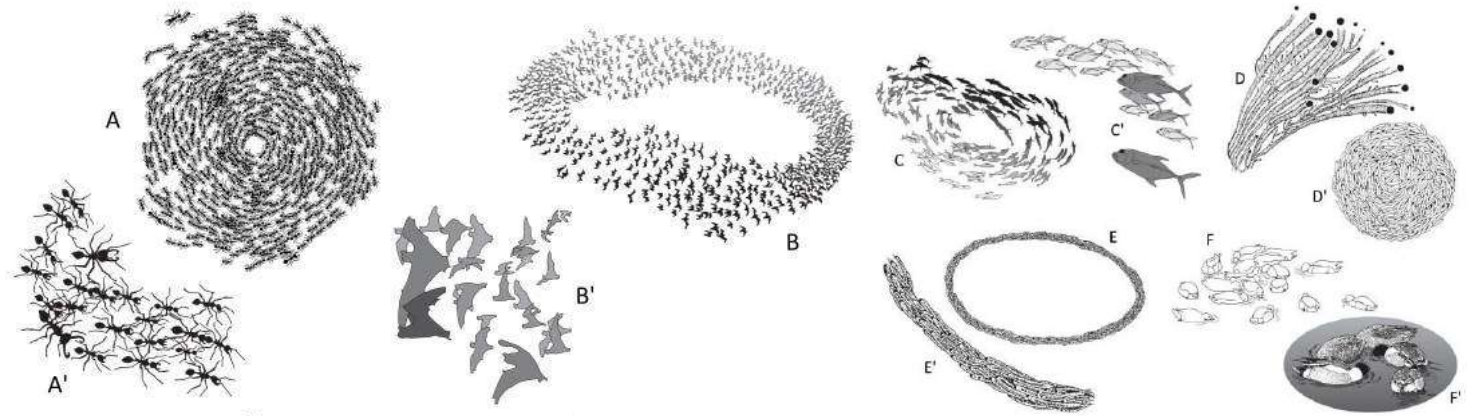

Reduces production (economic losses of £1,202.31 for flocks of 3,000 organic flock and £4,028.05 for 16,000 free-range flock)

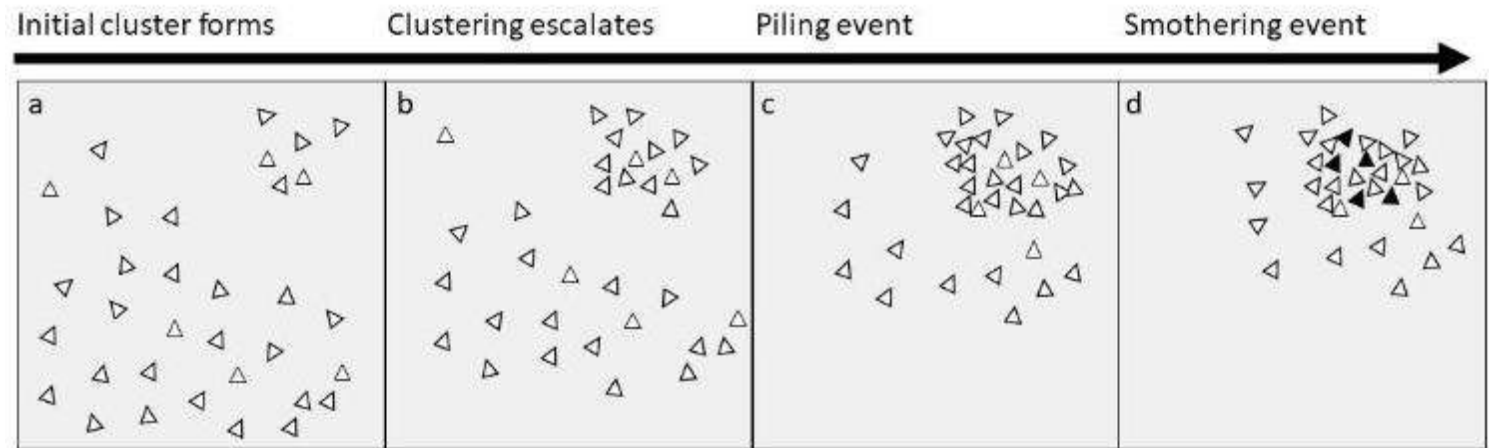

Why Piling?

- Vortexing behaviour
- Unpredictable
- Smothering
- Welfare effects
- Production reduction
- Staff effects
- Can be disrupted

Reproduced from Delcourt et al. (2016) [The Quarterly Review of Biology](#) 91(1):1-24

Methodology: Dataset

- 3 weeks of video collected from 8am to 8pm
- 10 flocks (brown, free-range, laying hens, UK farms).
- 18 to 72 weeks of age (mean = 37)
- Videos frames labelled as "Piling" or "Non-Piling" (Armstrong *et al.* 2023).
- 4 to 185 piles per flock (mean = 92)
- 49,908 total frames (33,669 Piling and 16,239 Non-Piling).
- 8 Flocks Training (39,676 Frames), 2 Flocks Testing (10,232 Frames)
 - Random subsamples from each used in Training / Testing

Dataset	Flock ID	Piling	Non-Piling
Training and Validation	A	1576	789
	B	511	240
	C	6449	2653
	D	3031	1155
	E	2532	1299
	G	3133	3259
	I	5247	2184
	J	3760	1858
	Total frames	26239	13437
Testing	F	4801	2058
	H	2629	744
	Total frames	7430	2802

Methodology: AI Model & Results

- ResNet Convolutional Neural Network (CNN).

- Established with image tasks
- Low complexity
- Widely available for transfer learning

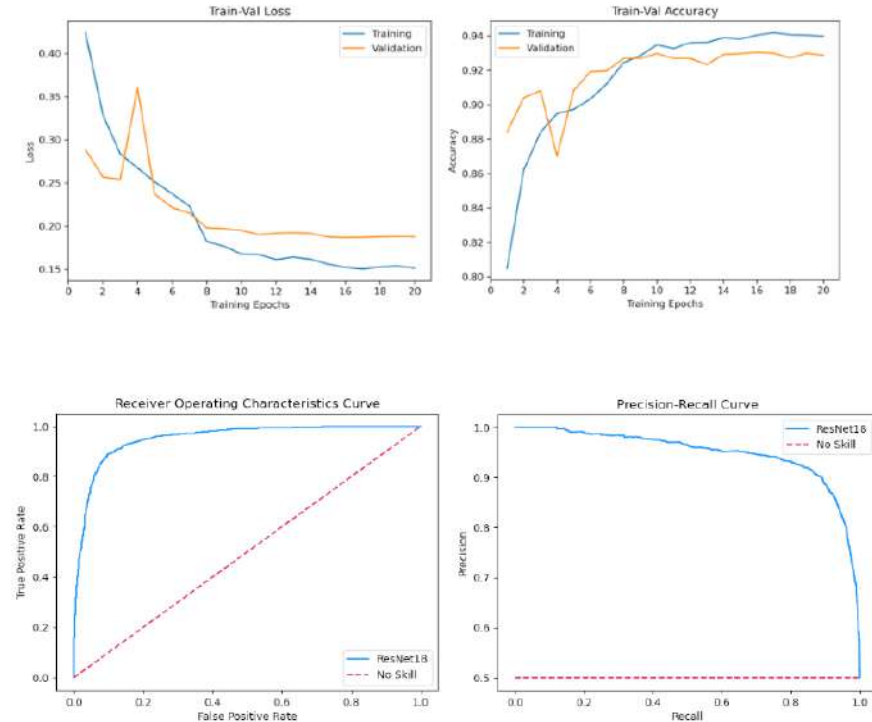

- Peak Training Performance:

- Accuracy: 0.9305
- Cross-Entropy Loss: 0.1867

- Validation Performance:

- Accuracy: 0.87
- Precision: 0.94
- Recall: 0.80
- Specificity: 0.95

		True	
		Piling	Non-Piling
Predicted	Piling	2006	139
	Non-Piling	494	2361

Misclassification Examples

Predicted: NONPILING, Actual: PILING
Prediction Probability: 0.90

Predicted: NONPILING, Actual: PILING
Prediction Probability: 0.77

Predicted: PILING, Actual: NONPILING
Prediction Probability: 0.73

Predicted: PILING, Actual: NONPILING
Prediction Probability: 0.52

Predicted: NONPILING, Actual: PILING
Prediction Probability: 0.67

Predicted: NONPILING, Actual: PILING
Prediction Probability: 0.84

Predicted: PILING, Actual: NONPILING
Prediction Probability: 0.89

Predicted: PILING, Actual: NONPILING
Prediction Probability: 0.85

Discussion: Viability

- Demonstrated viability of approach
- Good performance across flocks
- Misclassification causes?
 - Image quality
 - Flock-specific characteristics
 - Ambiguous cases
 - Lack of temporal information
- What about the piles not captured?

Discussion: Future Development & Considerations

- Future Development:
 - Video rather than single frames
 - Include additional data
 - Standard welfare measures
 - Environmental monitoring
 - Bioacoustics
 - Production measures
- Unanswered Questions:
 - Generalisability?
 - Frequency of piles vs potential for harm
 - Impact of 0 Piling?
